March 7th, 2022

# Outline – GAMS code, modules, and realizations

- What is GAMS?
- General structure of the MAgPIE Model
- Structure of modules and realizations
- Coding etiquette: Variable and parameter naming
- Brief exercise

# What is GAMS?

- MAgPIE is written in the **General Algebraic Modeling System (GAMS)** language

*"GAMS is a high level modeling system for **mathematical programming** and **optimization**. It consists of a **language compiler** and a range of associated **solvers**."*

All major commercial  
LP/MIP solver

Open Source Solver  
(COIN)

Also solver for NLP,  
MINLP, global, and  
stochastic optimization

Useful links:

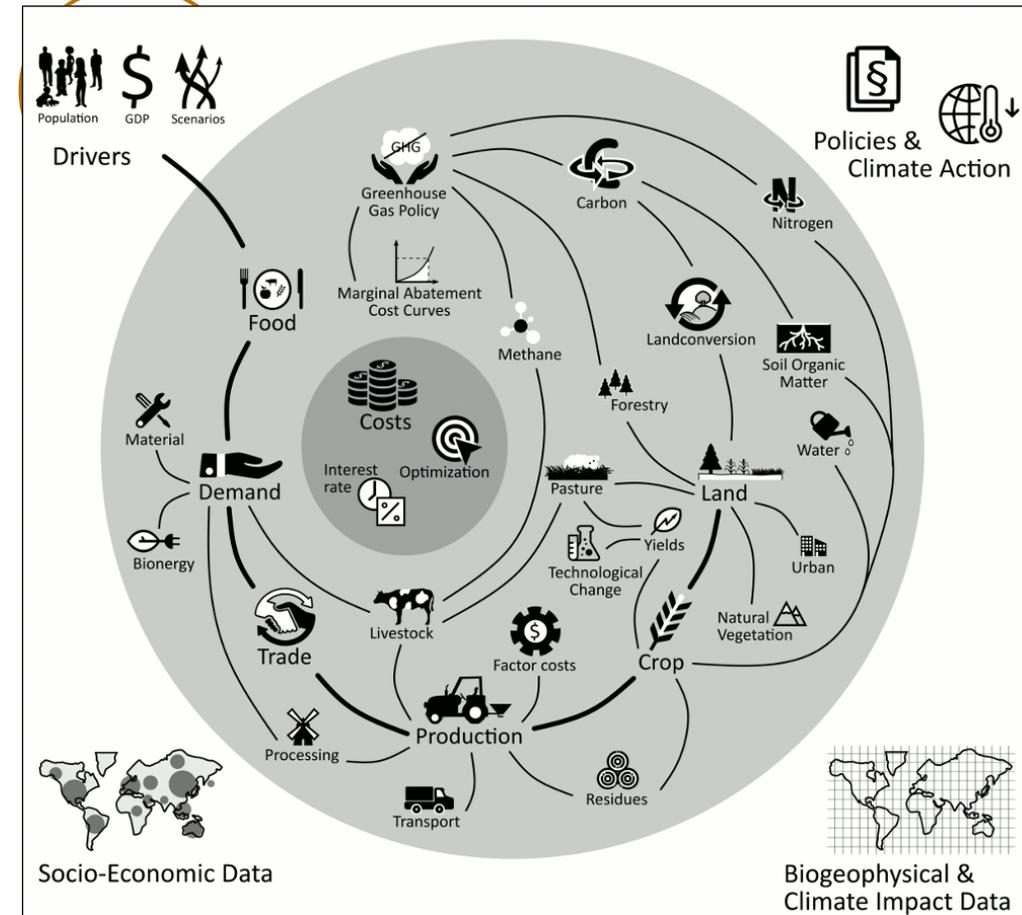

GAMS at a glance: <https://www.gams.com/products/gams/gams-language/>

GAMS documentation: <https://www.gams.com/35/docs/index.html>

# General structure of the MAgPIE Model

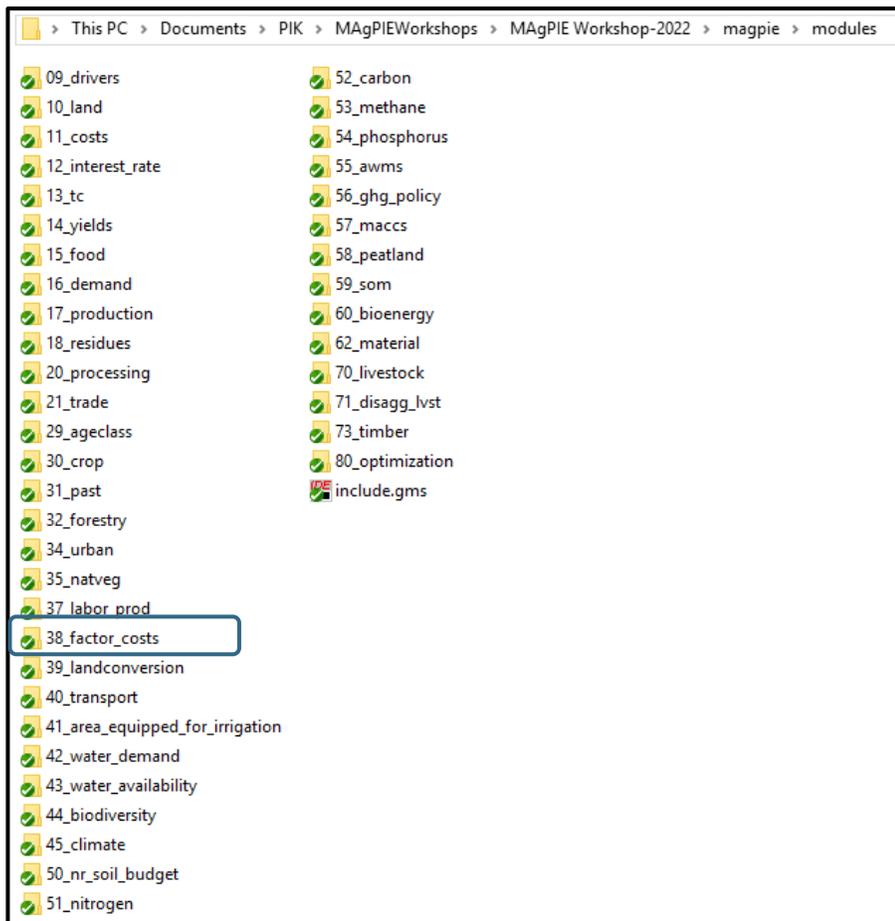

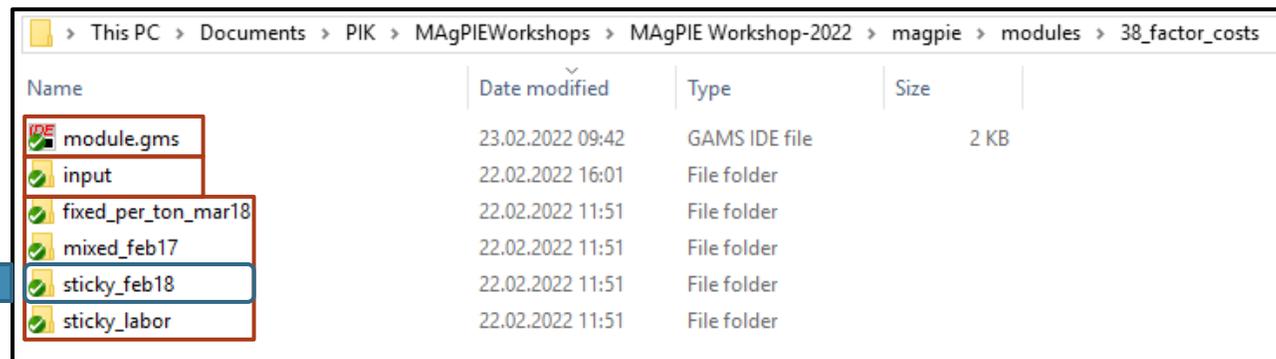

- Future **population** and **GDP** are the main drivers (different **scenarios**).
- **Food consumption** patterns lead to certain **demand**
- **Trade** patterns leads to regional **production**
- **Production and biophysical** yield and water availability data translate into **cropping patterns**.
- **Cropping patterns** drive **land use** decisions

These interactions and calculations are described in MAgPIE's modules

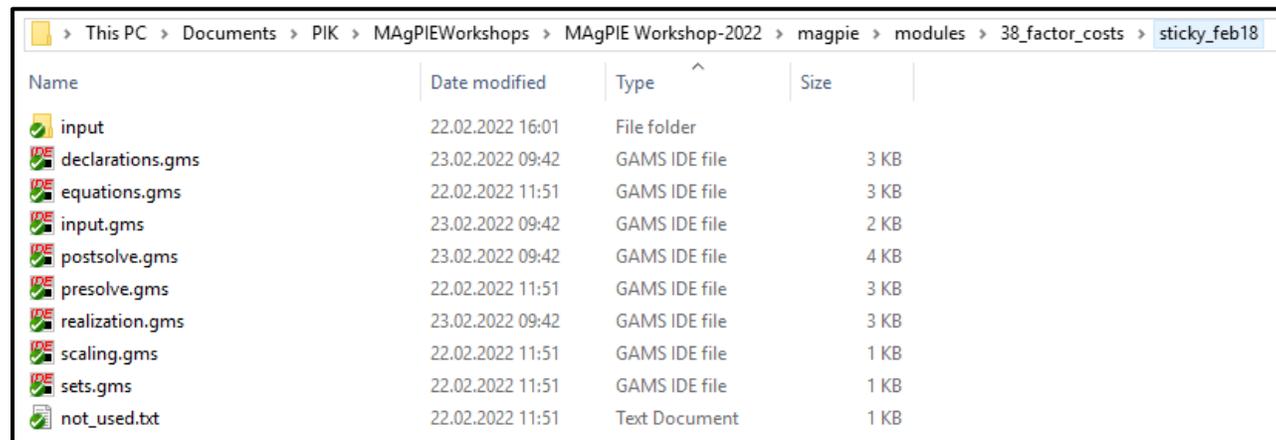

More info at: <https://rse.pik-potsdam.de/doc/magpie/4.4.0/>

Contains the final code used in the current MAgPIE run, based on the selected settings and on one realization per module

# Coding etiquette: Variable and parameter naming

```

equations
q38_cost_prod_crop(i,kcr)      Regi
q38_cost_prod_inv(i)          Regi
q38_investment_immobile(j,kcr) Cell
q38_investment_mobile(j)      Cell
;

positive variables
vm_cost_prod(i,kall)
vm_cost_inv(i)
v38_investment_immobile(j,kcr)
v38_investment_mobile(j)
;

parameters
p38_variable_costs(t,i,kcr)
p38_capital_need(t,i,kcr,mobil38)
p38_capital_immobile(t,j,kcr)
p38_capital_mobile(t,j)

p38_capital_cost_share(t,i)
p38_share_calibration(i)

p38_cropland_start(j,w,kcr)
;

##### R SECTION START (
parameters
ov_cost_prod(t,i,kall,type)
ov_cost_inv(t,i,type)
ov38_investment_immobile(t,j,kcr,type)
ov38_investment_mobile(t,j,type)
oq38_cost_prod_crop(t,i,kcr,type)

```

} q\_ equations

} v\_ variables

} p\_ processing parameters

} o\_ output parameter

```

$setglobal c38_sticky_mode free
* options: dynamic, free

scalars
*' Depreciation rate assuming roughly 20 years linear depreciation for investment goods
s38_depreciation_rate depreciation rate (share of costs) / 0.05 /
*' Share of immobile capital.
s38_immobile immobile capital (share) / 1 /
;

parameter f38_fac_req(kcr) Factor requirement costs in 2005 (USD05MER per tDM)
/
$ondelim
$include "./modules/38_factor_costs/sticky_feb18/input/f38_fac_req_fao.csv"
$offdelim
/
;

```

} c\_ switch

} s\_ scalars

} f\_ file parameter

... In other realizations you find:

```

i30_avl_cropland_iso(iso)    i_ input parameters
$macro m_timestep_length    m_ macros

```

Prefixes are extended using either **m** (used in multiple modules/core code) or a **two digit number** (only used in the current module).

# Coding etiquette: Variable and parameter naming

**Other** extensions to prefixes:

- ?c\_ current time step
- ?q\_ parameter containing the value of an equation
- ?v\_ parameter containing the values of a variable

```
pcm_land(j,land)
```

```
oq10_land(t,j,type)
```

```
ov_landreduction(t,j,land,type)
```

**Suffixes** indicate the **level of aggregation** of an object

- (no suffix) Highest disaggregation available
- **\_setname** aggregation **over set**
- **\_reg** regional aggregation
- **\_glo** global aggregation

```
i42_wat_req_k(t,j,k)
```

```
v11_cost_reg(i)
```

```
i32_max_aff_area_glo
```

# Exercise

(Green tick when you are ready) 

1. Within the magpie folder, find the **14\_yield** module.
2. Open the declaration.gms file of the **managementcalib\_aug19** realization
3. One example of:
  - Parameter used **only** within the current module
  - An equation
  - A processing parameter used in **at least in** this module and the core code.
  - An output parameter

# THANK YOU
